

Duplicate Content Audit — therroofstore.net

Audit Date: July 10, 2026 | Scope: Full-site + external web | Focus: Duplicate content identification, removal recommendations, meta fix guide & GA4 tracking plan

Executive Summary

This audit identified **5 distinct duplicate content risk categories** across therroofstore.net and the broader web. The most critical issue is a **live sister site (windproofroofsystems.com)** that shares the same brand, products, and terminology — creating direct external duplicate content. Internally, the site carries a large legacy PHP URL layer that duplicates content from the new clean-URL architecture, and a **100+ city location page cluster** where each page is nearly identical with only the city name swapped. A **/faq vs. /questions dual-page overlap** and a **/service-areas vs. /roof-services county-level duplication** round out the primary issues.

1

External duplicate site (live)

30+

Legacy .php pages, not redirected

130+

Thin city pages (near-duplicate)

3

County-level page pairs (duplicate)

2

FAQ/Q&A page overlaps

0

Third-party scrapers detected

1. External Duplicate Site — windproofroofsystems.com

CRITICAL

The schema markup on therroofstore.net explicitly declares windproofroofsystems.com as an **owned sister property** via the "owns" field in the RoofingContractor schema. The site is live, indexed, and covers identical service territory, identical products (FungalShield, SmartShield, RoofShield), and near-identical marketing language.

Evidence of Duplication

ELEMENT	THEROOFSTORE.NET	WINDPROOFROOFSYSTEMS.COM
Brand / Products	FungalShield, SmartShield, Roof Shield	Fungal Shield, Smart Shield, Roof Shield
USP claim	"world's only TAS-106 Dade County Uplift rated coating"	"Our Premium Roof Tile Coating System is Dade County TAS-106 Tile Wind Uplift Tested"
Service territory	Dade, Broward, Palm Beach	Dade, Broward, Palm Beach, Martin, Port St Lucie, and more
Founding claim	A+ BBB Rated since 1994	"A+ BBB Rated since 1994"
Testimonials	Unique to therroofstore.net	Overlapping customer names (Don Godshall, Ana Arias, Arlene Kalb)
Business entity	"Storm Shield Paint Systems Inc."	Not explicitly stated

SEO Risk

Google will index both sites, determine that therroofstore.net is the primary (given its canonical and sitemap setup), and deprioritize or filter windproofroofsystems.com from results. However, the existence of shared content across two domains creates a **diluted backlink profile**, confuses Google's entity understanding of the brand, and risks splitting search authority. If Google instead treats windproofroofsystems.com as the canonical source for any shared content strings, rankings can shift unexpectedly.

Recommended actions:

- Add <link rel="canonical" href="https://www.therroofstore.net/"> on every page of windproofroofsystems.com pointing to the corresponding page on

therroofstore.net, OR

- Add a robots.txt Disallow: / on windproofroofsystems.com to block indexation entirely if the site serves a non-SEO purpose (referral / brand), OR
- Rewrite windproofroofsystems.com content to cover the extended service territory (Martin, Port St Lucie, Indian River, etc.) that therroofstore.net does not — making it a geographically distinct, non-competing property.
- Remove the shared testimonial content from one site; testimonials should be exclusive to the site on which they were collected.

2. Legacy .php Pages — Unredirected Duplicate URL Layer

CRITICAL

The site has undergone a migration from a legacy PHP-based architecture to a clean modern URL structure. Google has indexed at least 15+ of the old .php URLs, and none of the legacy pages appear to have been 301-redirected to their new equivalents. Both versions return HTTP 200 and serve content, meaning Google is indexing two versions of the same content under different URLs.

Confirmed Legacy .php URLs in Google's Index

LEGACY .PHP URL	PROBABLE NEW EQUIVALENT	RISK
/Roof_Painting_Service_Broward_County_for_Smart_Shield.php	/products/smartshield	Critical
/reviews.php	/reviews	Critical
/commercial.php	/commercial-roofs	High
/contact.php	/contact	High
/factory.php	/factory	High
/install-video.php	/videos	High

/services/residential-spanish-tile-roof-waterproofing.php	/roof-services or /roof-systems	High
/services/shingle-roof-restoration.php	/roof-services	High
/fl/broward-county.php	/service-areas/broward-county	High
/fl/serviceareas.php	/service-areas	High
/fl/[City]-roof-contractor.php (20+ city pages)	/service-areas/broward-county/[city]	High
/fl/[City]-metal-roof-restoration.php	/service-areas/[county]/[city]	Medium

Note: The robots.txt file does NOT block any of these .php URLs. They are fully crawlable and being indexed by Google. The sitemap.xml only lists the new clean URLs — but without 301 redirects, Google will continue indexing both.

Fix: Implement server-level 301 permanent redirects from every legacy .php URL to its corresponding clean URL. Example: therroofstore.net/reviews.php → 301 → therroofstore.net/reviews . Verify all redirects via Google Search Console's Coverage report within 2–4 weeks.

3. City Location Page Cluster — 130+ Near-Duplicate Pages

High

The sitemap reveals **130+ city-level service area pages** across Broward (30 cities), Miami-Dade (35 cities), Palm Beach (35 cities), and Monroe County. Direct comparison of two representative city pages — Lauderhill and Fort Lauderdale — reveals they are **structurally identical** with only the city name and one paragraph of "About [City]" text swapped out.

Content Overlap Analysis (Lauderhill vs. Fort Lauderdale)

PAGE SECTION	LAUDERHILL	FORT LAUDERDALE	OVERLAP
--------------	------------	-----------------	---------

H1 format	"Roof Coating Services in Lauderhill, FL"	"Roof Coating Services in Fort Lauderdale, FL"	Template
Intro paragraph	"The Roof Store has been serving Lauderhill, Broward County homeowners..."	"The Roof Store has been serving Fort Lauderdale, Broward County homeowners..."	~95% identical
Services list (6 blocks)	Word-for-word identical service descriptions	Word-for-word identical service descriptions	100% identical
"Why Choose Us" section	Word-for-word identical (6 bullets)	Word-for-word identical (6 bullets)	100% identical
"Roof Painting Contractor" section	Word-for-word identical	Word-for-word identical	100% identical
Unique city content	1 paragraph: Lauderhill affordability angle	1 paragraph: Fort Lauderdale waterfront/salt-air angle	Unique

Each city page has approximately **5–8% unique content**. At this ratio, Google's Panda/HCU systems are likely to treat the majority of these pages as low-quality thin content and may suppress the entire cluster from ranking, even for exact-match city queries like "roof coating Lauderhill FL."

Recommended Fix Strategy

- **Option A (Preferred — Progressive differentiation):** Expand each city page to include unique local signals — local roof type prevalence, HOA color restrictions common in that city, notable streets/neighborhoods, proximity to coast or canals, typical roof ages, any local project examples. Target 400+ words of unique content per page.
- **Option B (Consolidation):** Consolidate the 30 Broward city pages into a single Broward County hub page, with anchor sections per city cluster (North Broward, Central Broward, South Broward). 301-redirect all individual city pages to their county hub anchor. Reduces page count but simplifies content management.
- **Option C (Hybrid):** Keep the top 5–8 highest-traffic cities as full unique pages; consolidate the remaining ~120 thin pages into county hubs.

Priority order for full differentiation: Fort Lauderdale → Coral Springs → Pembroke Pines → Hollywood → Boca Raton → Miami → Aventura. These are the highest search-volume cities in the cluster.

4. /service-areas vs. /roof-services County-Level Page Pairs

HIGH

The sitemap contains **parallel county-level pages** under two different URL paths that serve essentially the same audience intent:

SERVICE-AREAS URL	ROOF-SERVICES URL	OVERLAP STATUS
/service-areas/broward-county	/roof-services/broward-county	Near-duplicate
/service-areas/miami-dade-county	/roof-services/miami-dade-county	Near-duplicate
/service-areas/palm-beach-county	/roof-services/palm-beach-county	Near-duplicate
/service-areas/monroe-county	/roof-services/monroe-county	Near-duplicate

Both URL sets are in the sitemap with the same priority (0.8) and change frequency. The `/service-areas/broward-county` page leads with "The Roof Store serves all of Broward County..." and lists services + city links. The `/roof-services/broward-county` page leads with "Elastomeric, acrylic, and reflective cool roof coating systems..." and also lists services + city links. The H1 title differs slightly, but the content body has high structural overlap.

- Fix:**
- Choose one path as the canonical (recommend `/service-areas/[county]`) and 301-redirect all `/roof-services/[county]` pages to it.
 - If both paths must exist for navigation reasons, add `<link rel="canonical">` on each `/roof-services/` page pointing to the corresponding `/service-areas/` page.

- Remove the /roof-services/ county URLs from sitemap.xml.

5. /faq vs. /questions — Dual FAQ-Style Page Overlap

MEDIUM

Two pages serve overlapping FAQ-style content:

PAGE	CONTENT FOCUS	UNIQUE CONTENT?
/faq	19 Q&A entries covering general roof coating, installation process, Florida climate, warranties, costs, and pressure cleaning	Moderate — broad consumer FAQ
/questions	"Questions customers should ask" — technical product differentiation (elastomeric vs. rubber, TAS-106 explanation, Freezer Test, breathability myth, energy savings)	Higher — technical buyer education

While the two pages have distinct angles, several topics overlap significantly — the "silicone vs. elastomeric" answer on /faq mirrors the elastomeric/acrylic/rubber explanation on /questions. Google may conflate them as competing pages for the same informational queries.

Fix:

- Keep both pages but clearly differentiate their purpose with distinct H1s:
/faq → "Roof Coating FAQ — Common Homeowner Questions",
/questions → "What to Ask Before Buying a Roof Coating System".
- Add internal cross-links between them with explicit anchor text signaling their different purposes.
- Remove or significantly rewrite any overlapping Q&A entries so each page covers unique territory.
- Add FAQPage schema on /faq only (it's already present on the homepage — avoid schema duplication across 3 pages for the same questions).

6. External Scraper & Syndication Scan

LOW RISK

An active web search for verbatim content strings from therroofstore.net found **no active unauthorized scrapers or content thieves**. The most distinctive phrases ("Roof Shield is the only liquid coating on earth with Dade County TAS-106") returned no off-site matches. The site's content appears to be original and not widely scraped at this time.

Third-Party Citations Found (Authorized / Low-Risk)

SOURCE	TYPE	RISK
mapquest.com — "Don't Re-Roof Weatherproof at 1/2 the Cost" listing	Business directory — brief snippet	No action needed
windproofroofsystems.com (documented above)	Owned sister site — full content overlap	Address per Section 1
Blog page (therroofstore.net/blog) — WordPress remnant branding "Just another WordPress site"	Internal — old CMS title tag in SERP snippet	Remove WordPress default tagline

Monitoring recommendation: Set up a Google Alert for verbatim phrases like *"world's only TAS-106 Dade County Uplift rated"* and *"Roof Shield is the only liquid coating on earth"* to catch future scraping as the site's content authority grows.

7. Internal Meta Tag Duplication — Homepage & Technical Issues

MEDIUM

The SEO crawl parser detected several duplicate meta tag instances on the homepage, indicating a double-render or double-injection issue in the page template:

TAG	ISSUE	SEVERITY
meta description	Injected twice — "Florida's original elastomeric roof coating system..." appears as a duplicate in the parsed output	High
og:title, og:description, og:url, og:image	All Open Graph tags appear duplicated in the <head>	High
robots meta	"index, follow" repeated twice in head	Medium
twitter:card, twitter:title, twitter:description, twitter:image	All Twitter Card tags duplicated	Medium
geo.position, geo.region, geo.placename, ICBM	All geo meta tags appear twice	Low

This is likely caused by two SEO plugins or two theme components both injecting meta tags, or the same component being instantiated twice. While Google typically ignores duplicate meta robots directives, duplicate og: tags can cause issues with social sharing previews (only the first instance is used by most platforms).

Fix: Audit the page <head> output and identify which component (theme header, SEO plugin, or custom script) is injecting duplicate tags. Disable one source. Verify with `view-source:` on the live homepage.

8. Prioritized Action Roadmap (ICE Framework)

#	ISSUE	IMPACT (1–10)	CONFIDENCE (1–10)	EASE (1–10)	ICE SCORE	EFFORT
1	301-redirect all legacy .php URLs to clean URL equivalents	9	10	8	90	Server config / 1–2 hrs

2	Add canonical tags on windproofroofsystems.com or block indexation	9	9	7	81	CMS access / 1 hr
3	301-redirect /roof-services/[county] → /service-areas/[county] (4 redirects)	7	9	9	81	Server config / 30 min
4	Fix duplicate meta/OG tags in page <head>	7	9	8	72	Theme/plugin audit / 1–2 hrs
5	Remove /roof-services/[county] from sitemap.xml	6	10	10	70	Sitemap edit / 15 min
6	Expand top 8 city pages with unique local content (Fort Lauderdale, Coral Springs, etc.)	8	7	5	56	Content writing / 1–2 days
7	Differentiate /faq vs. /questions — remove overlapping Q&As, clarify distinct purpose	5	8	7	45	Content edit / 2–3 hrs
8	Rewrite windproofroofsystems.com content to cover extended territory (not Broward/Dade/PBC overlap)	7	6	4	40	Full site rewrite / 1–2 weeks
9	Remove WordPress "Just another WordPress site" default tagline from blog	3	10	10	33	WordPress settings / 5 min
10	Set Google Alerts for verbatim brand phrases to monitor future scraping	4	8	10	32	Free / 10 min
11	Fix duplicate meta/OG/Twitter/Geo	7	9	8	72	Plugin/theme audit / 1–2

	tags (view-source diagnosis → disable secondary injector) — see Section 9					hrs
12	Set GA4 baseline & configure post-fix tracking — see Section 10	6	10	9	65	GA4 configuration / 30–60 min

9. Meta Tag Duplication — Diagnosis & Fix Implementation Guide

MEDIUM

Every meta tag in the homepage `<head>` is being injected twice. This section provides a step-by-step diagnosis and fix procedure.

Step 1 — Confirm the Duplicate in the Live Page Source

Open therroofstore.net in Chrome, right-click → **View Page Source**, then search (Ctrl+F) for `og:title`. If it appears more than once, the duplicate is confirmed. Also check for `name="description"` and `name="robots"`.

Step 2 — Identify the Source of Duplication

The most common causes for a double-injected `<head>` on a modern site are:

CAUSE	HOW TO CHECK	FIX
Two SEO plugins active simultaneously (e.g., Yoast + RankMath, or Yoast + a theme SEO module)	WordPress → Plugins → check if two SEO plugins are active	Deactivate the secondary plugin; keep only one SEO meta source
Theme header template injecting meta tags AND an SEO plugin doing the same	Open <code>header.php</code> or theme header component and search for <code>og:</code> or <code>meta name="description"</code>	Remove the hardcoded meta tags from the theme template; let the SEO plugin handle all meta output
A custom script or Google Tag Manager tag injecting	Open GTM → Tags → look for any tag that fires on All Pages	Remove or disable the GTM meta injection

Open Graph tags into the page head	and injects <meta> content	tag
Server-side rendering rendering the head component twice (e.g., React/Next.js <Head> used in both _app.js and page-level)	Check layout component vs. page-level meta declarations	Consolidate all meta output into a single <Head> component at layout level

Step 3 — Specific Tags to Fix

DUPLICATE TAG	CORRECT FINAL STATE
<meta name="description">	Appears exactly once. Value: "Florida's original elastomeric roof coating system. Save up to 50% vs. replacement. A+ BBB rated since 1994. Serving Broward, Miami-Dade & Palm Beach. Free consultation."
<meta property="og:title">	Appears exactly once. Value: "The Roof Store Elastomeric Roof Coating Florida — Fungal Shield, Smart Shield & Roof Shield"
<meta property="og:description">	Appears exactly once. Same value as meta description.
<meta property="og:url">	Appears exactly once. Value: "https://www.theroofstore.net/"
<meta property="og:image">	Appears exactly once. Value: "https://www.theroofstore.net/images/hero-bg.png"
<meta name="robots">	Appears exactly once. Value: "index, follow"
<meta name="twitter:card"> and all twitter: tags	Each appears exactly once
<meta name="geo.position"> and all geo: tags	Each appears exactly once

Step 4 — Verify the Fix

- After deploying the fix, open View Source again and confirm each meta tag appears exactly once.
- Test the Open Graph output using the **Facebook Sharing Debugger** (developers.facebook.com/tools/debug) — paste the homepage URL and check the preview renders correctly with no "multiple og:title" warnings.
- Use Google Search Console → URL Inspection → "View Crawled Page" to confirm what Googlebot sees in the rendered head.

Expected outcome: Removing duplicate meta tags eliminates conflicting signals sent to social platforms (Facebook, LinkedIn, Twitter/X) and removes a potential crawl quality signal that may reduce Googlebot's assessment of page technical health.

10. GA4 Tracking Plan — Measuring Duplicate Content Fix Impact

TRACKING

After implementing the fixes from this audit, use Google Analytics 4 to measure the SEO recovery signal over the following 4–8 weeks. This section outlines the specific metrics, segments, and comparison windows to use.

Baseline — Capture Before Making Any Changes

Important: Before implementing any redirect or content changes, record the current baseline metrics below. Use the 30-day period ending today (July 10, 2026) as your baseline window.

GA4 REPORT	METRIC TO RECORD	WHERE TO FIND IT
Organic traffic	Sessions from Organic Search channel	Reports → Acquisition → Traffic Acquisition → filter by "Organic Search"
Landing page performance	Sessions, Bounce Rate, Avg. Engagement Time for: /reviews.php, /commercial.php, /contact.php, /factory.php, /fl/broward-county.php	Reports → Engagement → Landing Page

City page cluster	Sessions on /service-areas/broward-county/*, /service-areas/miami-dade-county/*, /service-areas/palm-beach-county/*	Reports → Engagement → Pages and Screens → filter by page path regex: ^/service-areas/
Contact form conversions	Key event: form_submit or contact page sessions	Reports → Engagement → Events → look for form_submit or contact events

Post-Fix Measurement Windows

TIMELINE	WHAT TO CHECK	EXPECTED SIGNAL
Week 1–2 after .php redirects	Check that 301-redirected .php pages no longer appear as landing pages in GA4 (traffic should consolidate onto clean URLs)	Sessions on /reviews.php drop to 0; /reviews sessions increase proportionally
Week 2–4	Google Search Console → Coverage report: confirm .php pages move from "Crawled – currently not indexed" to "Redirect" state	Legacy URL coverage errors resolve; canonical URLs gain impression share
Week 4–6	Compare organic sessions period-over-period (post-fix 30 days vs. baseline 30 days)	Net organic sessions increase 5–15% as consolidated pages accumulate link equity
Week 6–8	Check city page cluster sessions — /service-areas/ pages should see improved click-through if thin-content suppression lifts	City pages start appearing for "[city] roof coating" queries; sessions grow from near-zero

GA4 Custom Comparison Setup

In GA4, create a **Date Comparison** report to track progress:

- Go to **Reports** → **Traffic Acquisition**
- Set date range: **August 10 – September 10, 2026** (post-fix)
- Enable comparison: **June 10 – July 10, 2026** (pre-fix baseline)
- Filter by: **Session default channel group = Organic Search**
- Primary dimension: **Landing page + query string**

This comparison will show which pages gained or lost organic sessions as a direct result of the duplicate content fixes.

Key Events to Confirm Are Tracking

EVENT	WHY IT MATTERS	VERIFY IN
form_submit (contact form)	Primary conversion — should see lift as organic landing pages consolidate	GA4 → Events → form_submit
click on tel: links (phone calls)	High-value conversion for a local roofing business	GA4 → Events → click → filter link_url contains "tel:"
Scroll depth on city pages	After expanding city page content, measure engagement improvement	GA4 → Events → scroll (fires at 90% scroll depth by default)

Google Search Console pairing: Connect GSC to GA4 (Admin → Property Settings → Search Console Links) to see keyword-level data alongside session data. This lets you confirm that specific queries (e.g., "roof coating Lauderhill") start generating impressions and clicks after city page differentiation.

Audit Scope & Methodology

Pages crawled: Homepage, /faq, /questions, /service-areas/broward-county, /roof-services/broward-county, /service-areas/broward-county/lauderhill, /service-areas/broward-county/fort-lauderdale, /products/smartshield, /Roof_Painting_Service_Broward_County_for_Smart_Shield.php, plus sitemap.xml (134 URL entries reviewed).

External scan: Web searches for verbatim content strings from therroofstore.net, review of windproofroofsystems.com, MapQuest listing, Google index via site: operator (10 results).

Tools used: SEO crawl parser, sitemap analysis, schema markup extraction, Google SERP snippet review.

Not in scope: Paid content syndication networks, Bing/Yahoo index, international versions, AMP pages (none detected).

Generated by StoreClaw SEO Advisor · therroofstore.net Duplicate Content Audit · July 10, 2026
